

Runwise Deployment Guide

Runwise deploys to [Vercel](https://vercel.com/) automatically on every merge to main.

Architecture

```
GitHub (main branch)
  %
  %¼
  Vercel CI/CD
    %
    % % % Build: npm run build (SvelteKit + Vite)
    % % % Deploy: @sveltejs/adapter-vercel
```

Vercel Configuration

The project uses @sveltejs/adapter-vercel with no custom vercel.json required. Vercel auto-detects SvelteKit.

Environment

First-Time Setup

- Import the GitHub repository into Vercel
- Vercel detects SvelteKit automatically — no manual configuration needed
- Every push to `main` triggers a production deployment
- Every PR gets a preview deployment URL

Deployments

Local Production Preview

```
npm run build
npm run preview
```

Opens a local server serving the production build at http://localhost:4173.

Monitoring

View deployment status, build logs, and runtime errors in the [Vercel dashboard](https://vercel.com/dashboard).
